

Pioneer Parking Build Brief

Valet retrieval app & website refresh — requirements session

Date	September 10
Client	Jonathan Cohen — Pioneer Parking (Owner / Principal)
VisMedAI Advisory	Dima · Amal Amaskane
Format	Zoom · screen-shared prototype walkthrough
Recording	https://fathom.video/share/pbxjyvJ9RE1tzsfhtsezDF-wD6YNBv1n

SCOPE OF THIS REPORT

Covers the working session from the point Jonathan joined. Pre-meeting setup, audio/video and screen-share troubleshooting, and internal team chatter are excluded.

1. Executive summary

Two workstreams were defined and scoped, with a third named and deliberately deferred.

Workstream 1 — Valet retrieval app (primary)

Jonathan will fund a purpose-built valet retrieval application to replace ElimaWait (~\$165/mo), which he considers unreliable and inflexible. The MVP is deliberately narrow: approved recurring monthly parkers only, request-and-retrieve workflow, three staff role levels, in-app notifications. He reviewed the prototype and raised no material objections beyond administrative backup when a garage manager is unavailable. The product is to be architected from day one for **licensing to other parking operators**.

Workstream 2 — Website refresh (secondary, fast)

The current WordPress/GoDaddy site is outdated and does not support the company’s growth thesis. The refreshed site targets HOA boards, private owners and property managers, built around a new 2.5-minute corporate video, testimonials and team credibility — while deliberately de-emphasizing specific garage locations.

Workstream 3 — Transient ticketing digitization (deferred)

Explicitly outside MVP scope. Jonathan frames the reservation app as the quick win that precedes this larger, operationally critical project.

DECISION POINT

Tuesday at 12:00 noon, Zoom. VisMedAI presents MVP scope, timeline and cost, plus website direction, structure, turnaround and cost.

2. Strategic framing

DIMENSION	POSITION
Why replace ElimaWait	Unreliable in operation, inflexible to Pioneer's workflow, ongoing cost (~\$165/mo) with zero ownership or control over the roadmap.
Ownership thesis	Jonathan wants to own the platform outright — control the feature set, the data and the economics.
Licensing thesis	The app should be designed as a product other parking operators can license, not a Pioneer-only internal tool. Company structure, product name and branding must stay flexible to support this.
Sequencing	Reservation/retrieval app first (fast, contained win), then transient ticketing digitization (larger, higher operational stakes).
Website's role	Not a brochure. A credibility and scalability instrument to win HOA boards and private property owners as Pioneer expands.

3. Jonathan’s app requirements & preferences

This section consolidates every design, functional and preference statement attributed to Jonathan during the session. Items marked **Open** were not resolved in this meeting.

3.1 MVP scope boundaries

- **In scope:** registered, approved, recurring **monthly** customers — both residents and non-residents of the property.
- **Out of scope:** guests and transient parkers. These continue on physical tickets and the existing credit-card payment process; they carry a separate payment workflow and do not belong in the MVP.
- **Function:** the application handles **reservations / retrieval requests** — not universal location-wide alerts or broadcast messaging. Jonathan explicitly clarified this narrowing.
- **Not a billing system.** The app is not being designed to support billing, which is why valet-side history can be short.

3.2 Multi-location architecture

- **Central administration model** for adding new locations as Pioneer expands.
- Each location operates a **location-specific secure access code** used during customer registration.
- **Location-specific customer databases** — records are scoped to the garage.
- **Simple location setup** with **one primary identifier** per location: decal number, apartment number or unit number, whichever that property uses.
- Records must carry a **location identifier**.

3.3 Customer onboarding & approval

#	ACTOR	ACTION
01	Customer	Scans the QR code posted at the location
02	Customer	Enters the location-specific access code
03	Customer	Submits registration details — name, vehicle information, unit / decal number
04	Manager	Request routes to the Garage Manager to approve or reject
05	System	Approved customer gains access to the request workflow

Manager-supported provisioning: the Garage Manager can create customer records directly.

OPEN — CUSTOMERS WITHOUT SMARTPHONES

Discussed at length. QR-code assistance and manager-supported setup were considered, and a **manual override path** was identified as a likely requirement. Not resolved. Needs a decision before build — it affects the data model, the manager UI and the retrieval workflow.

3.4 Vehicle request workflow — the core loop

#	ACTOR	ACTION
01	Customer	Taps Request Now
02	Valet tablet	Receives an audible, repeating chime that continues until accepted
03	Valet	Taps Accept
04	Customer	Status changes to Retrieving Vehicle
05	Valet	Taps Ready
06	Customer	Receives a push notification that the vehicle is ready for pickup

JONATHAN'S EXPLICIT PREFERENCES ON THIS LOOP

- **The chime must be persistent but not annoying.** It repeats until a valet accepts — a deliberate operational forcing function — but the sound design matters to him.
- **Notify on "Ready" as the default.** The customer's required notification is when the vehicle is ready.
- **Optional earlier updates.** Customers may opt in to "Retrieving Vehicle" status updates via a notification-preference toggle.
- **Customer visibility is the point.** The driving goal is that customers can see retrieval progress and avoid standing around waiting unnecessarily.
- **Cancellation is required.** Customers must be able to cancel a request **before it is accepted**. The request-state flow was tested in-session to determine when the cancel option should surface.

3.5 Notifications

- **In-app push notifications only. No SMS.** Jonathan stated this preference directly.
- Customer-controlled preference for optional retrieval-status updates (see 3.4).

3.6 Valet queue & operational history

- Queue must organize **immediate, next-day** and **future** pickups.
- Valet interface retains a **limited recent-completion history** — Jonathan indicated records older than **two or three days** can drop off the valet view, since the platform is not doing billing.
- **Dedicated valet devices** — tablets, touchscreen workflow.
- Existing **request-duration indicators** were reviewed.
- Future consideration: location-level **average fulfillment time** reporting.

3.7 Roles & permissions

ROLE	SCOPE	PERMISSIONS
Office Administrator	Central — all locations	CAN: create locations; create and assign location managers and valet accounts; assign location-specific credentials; regenerate valet access codes; remove and replace users. FLAGGED: must be able to intervene when a garage manager is unavailable — Jonathan’s single flagged gap in the prototype. Pending approvals must not stall on manager absence.
Garage Manager	Single location — remote access	CAN: approve / reject customer registration requests; edit customer and vehicle information; manually provision customer accounts; work remotely without being on site.
Valet	Dedicated device — queue only	CAN: view the active queue; accept requests; mark vehicles Ready; view registered records. CANNOT: edit customer or vehicle data; view customer phone numbers — called out by Jonathan as a privacy restriction. Phone access is preserved for authentication and management at higher role levels.
Customer	Approved monthly parker	CAN: register via QR + access code and await approval; request a vehicle and track status; cancel a request before acceptance; manage multiple vehicles; set notification preferences.

3.8 Customer & vehicle data

- **Simple first-name search** — Jonathan emphasized this specifically as the search behavior he wants.
- **Editable** vehicle and customer information, with **approval controls on changes**.
- **Multiple vehicles per customer** supported.
- **Decal / unit-number field** on vehicle records — a specific addition Jonathan requested.
- **Generic vehicle images.** No customer photo uploads. The system auto-generates or maps a generic image from **make, model and color**. Rationale: reduces data load and avoids privacy exposure. VisMedAI to define the brand / model / color to image mapping set.

3.9 Data retention

- **Full historical activity retained permanently** in the backend repository.
- Purposes: metrics and reporting, customer complaints, **legal support**, and vehicle-related disputes.
- **Split from the UI:** the valet-facing interface shows only recent activity (2–3 days); retention happens behind it.

3.10 Feedback / bug reporting

- The prototype’s **comment-and-screenshot feature** was examined.
- Direction: reposition it as an **internal bug-reporting tool**, not a general customer feedback channel.
- Action: clarify intent and **adjust its presentation** accordingly.

3.11 Product & commercial design constraints

- **Design for licensing** to other parking operators from the outset.
- Keep the product's **company structure, name and branding flexible** — do not hard-bind it to Pioneer Parking.
- **App store deployment** required.
- **Scalable backend infrastructure**, with **hosting and maintenance** provided by VisMedAI.
- The reservation app is positioned as the **quick win preceding the larger ticketing project**.

4. Website refresh

Objective

Elevate the Pioneer Parking brand to win **HOA boards, private property owners and property managers**. The site must support — and visually justify — the company’s growth trajectory.

Positioning

- Emphasize **corporate presentation, private ownership and operational expertise**.
- **De-emphasize specific locations**. Jonathan wants to demonstrate capability and success **without publishing exact garage locations** — projecting a larger, more professional footprint.
- **Keep the website separate from the reservation app** as a brand and as a property.
- VisMedAI’s counter-emphasis: build the site so it scales as Pioneer adds properties, rather than as a snapshot of today.

Content

ELEMENT	DETAIL
Corporate video	~2.5 minutes, the site centerpiece. The file received was blurry and too large for direct web delivery. Jonathan to resend the high-quality source via Google Drive; VisMedAI will downsample and optimize for web.
Testimonials	Google reviews, surfaced on-site.
Team	Manager headshots and team imagery — the diversity of Pioneer’s team was noted as a genuine asset.
Proof points	Multiple-location success stories, presented without naming exact locations.
Photography	Jonathan to supply photos.

Technical

- Current stack: **WordPress on GoDaddy** — outdated; requires a full refresh.
- Website administration model to be reviewed.
- Deliverables for Tuesday: **proposed direction, site structure, turnaround time and cost**.

5. Future project — transient ticketing digitization

Explicitly **outside MVP scope**, but framed by Jonathan as critical to Pioneer’s growth and scalability.

SCOPE DISCUSSED

- Digitizing the current paper-based transient ticket system.
- Digital payments and QR scanning.

- Tax records.
- Shift reporting.

COUPON MANAGEMENT

- Treated as a **separate module or add-on**.
- Requires **serialization** and **governance controls** to expand safely across many garages.

JONATHAN'S COMMITMENTS TO ENABLE THIS

- Provide existing **transient-parking report formats** and process details.
- Demonstrate the **end-to-end ticketing and coupon-processing workflow** in a dedicated future session.

6. Action items

VisMedAI

#	ACTION	OWNER
01	Review the prototype and existing materials; send consolidated questions to Jonathan	Team
02	Draft MVP scope, timeline and cost for the reservation app	Team
03	Draft the website refresh proposal — direction, structure, turnaround, cost	Team
04	Define generic vehicle-image mappings (brand / model / color)	Team
05	Restrict valet access to phone numbers while preserving access for authentication and management	Team
06	Add or confirm customer notification preferences for optional retrieval-status updates	Team
07	Ensure customers can cancel requests before acceptance	Team
08	Add a decal / unit-number field to vehicle records	Team
09	Clarify whether the comment/screenshot feature stays as an internal bug-reporting tool; adjust presentation	Team
10	Consider a manual registration path for customers without smartphones	Team
11	Design the application with licensing to other operators in mind	Team
12	Build on a scalable backend with hosting and maintenance support	Team
13	Optimize the promotional video for web delivery once the high-quality file arrives	Team
14	Send the Zoom invite for Tuesday 12:00	Dima
15	Present website direction and recommendations on Tuesday	Team

Jonathan Cohen

#	ACTION
01	Review the linked materials and send questions to the team
02	Send EPS / vector logo to Dima — Dima will extract from JPEG if no vector exists
03	Resend the corporate video in higher quality via Google Drive or similar file-sharing service
04	Send high-resolution photos for the website via Drive
05	Provide existing transient-parking report formats and process details (future initiative)
06	Demonstrate the end-to-end ticketing and coupon-processing workflow in a separate future session
07	Attend the Tuesday 12:00 Zoom to review app scope and website refresh

7. Open questions & risks

UNRESOLVED IN-SESSION

1. **No-smartphone customers.** Identified as a real segment; manual override discussed but not decided. This affects the data model (records without an authenticated user), the manager UI and the retrieval workflow. Needs resolution before build starts, not during.
2. **Manager-absence backup.** Jonathan's only prototype concern. The administrator override path needs an explicit design — who is notified, what SLA applies to pending approvals, and whether approvals can escalate automatically.

RISKS WORTH NAMING IN TUESDAY'S PROPOSAL

1. **Licensing ambition vs. MVP cost.** "Design for multi-operator licensing" and "ship a fast MVP" pull against each other. Multi-tenancy, per-tenant branding and per-tenant credentials are architectural decisions that are cheap now and expensive later — but they are not free in the MVP. Recommendation: build true tenant isolation into the data model from day one; defer white-label theming and any operator-facing admin surface. State the tradeoff explicitly so it is Jonathan's call.
2. **Permanent retention vs. privacy posture.** Indefinite retention for legal and dispute purposes is defensible, but it needs a written retention and access policy — especially given the deliberate restriction of phone numbers from valets. The policy belongs in scope, not as an afterthought.
3. **App store review timelines.** Two store submissions sit on the critical path to launch and are outside VisMedAI's control. Build review cycles into the timeline presented Tuesday rather than absorbing them as slippage.
4. **Valet tablet reliability.** The persistent chime is the operational backbone of the workflow. Device sleep behavior, connectivity loss and background-notification handling on dedicated tablets will determine whether the app actually beats ElimaWait on reliability — which is the entire premise for replacing it. Worth an explicit line item.
5. **IP ownership.** If Jonathan funds the build and intends to license the product, IP ownership, license terms and revenue share need to be settled in the commercial agreement — before code exists, not after.

8. Next meeting

Tuesday, 12:00 noon — Zoom. Invite from Dima.

AGENDA

1. MVP scope, timeline and cost for the valet retrieval app.

2. Website refresh — direction, structure, turnaround, cost.
3. Review of the high-quality corporate video.
4. Resolution of the two open items: no-smartphone path, manager-absence backup.

Appendix A — Adjacent commercial discussion

Recorded for completeness. Not app or website scope.

- Jonathan updated the group on his **outreach to 777**.
- He **removed the performance-incentive hurdle** from the proposal.
- He **reduced the proposed amount from 100 to 70**.
- The group noted that **Metropolis retaining a 50% position** could remain problematic.

Appendix B — Sources

Compiled from the Fathom recording summary and the Read.ai meeting summary of the September 10 session. Content preceding Jonathan's arrival — technical setup, audio/video and screen-sharing troubleshooting, and internal team discussion — has been excluded per instruction.
